

# SPRING PEEPER

## The Tiny Frog with a Giant Voice

*Peep! Peep!* If there's a wetland nearby, listen for loud peeps at night. These sounds come from a tiny frog called a spring peeper. In the spring, male peepers choose a patch of wetland about the size of a hula-hoop. Then they peep to attract female spring peepers.

### Meet the Spring Peeper

Peepers can handle cold weather. In the winter they can freeze nearly solid!

Peepers usually have an X-shaped mark on the back (this one has more of a Y).

They have sticky pads on the feet to help them climb plants.

They can change into different shades of brown and tan to match the colors of the dead leaves on the forest floor.

### Listen for Peepers

It can be hard to see a spring peeper. They are very small. A full-grown male can fit on top of a quarter. Females are larger—sometimes twice as large as males—but that's still not very big! While listening for that peeping sound, investigate a little...

 Besides peeps, can you hear another sound like *brrrrrrt*? That's a special call made by a male spring peeper who's telling a nearby male, "You're way too close! Get lost!"

 What day of the year do you hear spring peepers start calling? Write this down and compare it with dates from year to year!

 Can you hear any other spring nighttime animals? Wood frogs going *quack quack*? Woodcocks going *peent*?

### Peeper Paper Puppets

- Materials:
- a paper lunch bag
  - glue and/or tape
  - construction paper
  - something to color with
  - scissors

#### TIPS!

- 1) Wrap the tongue cutout around a pencil to make it curl
- 2) Use markers or crayons to make your frog blend in to the forest floor
- 3) Use a marker to draw the X on the back of your paper bag and you'll have the perfect peeper!
