Grasslands & Farmlands

In Massachusetts, grasslands are created and maintained by natural or human-caused disturbances. Grasslands provide crucial habitat for wildlife, including pollinators like bees, butterflies and birds. Farms and gardens support local food production.

ECONOMIC & HEALTH

Community Gardens help increase community cohesion, connecting people with nature and accessible, healthy food. Additional benefits include their important role in stormwater management.

Pollinators contribute $24B to the U.S. economy.

45% of our agricultural commodities in Massachusetts rely on the rich diversity of pollinators for crop pollination.

22-35% profit increase from practicing organic farming instead of conventional, based on 40 years of studies covering 55 crops on five continents.

$475K Total market value for agriculture in Massachusetts in 2017.

FARMING FOR THE FUTURE

Regenerative agriculture is a crucial piece of the sustainability puzzle. While conventional farming employs large amounts of pesticides, fertilizers, energy, and water, regenerative agriculture centers on soil health and productivity, minimizing environmental impact. This practice often goes hand in hand with “carbon farming” to improve conversion of atmospheric CO₂ to plant material and soil organic matter.

Visit our website to read about how Mass Audubon’s Drumlin Farm is employing regenerative methods.

CLEAN WATER

12M gallons Estimated amount of stormwater retained annually by raised beds alone in New York City’s community gardens.

CARBON CAPTURE & STORAGE

0.95 tons Reduction in equivalent CO₂ released into the atmosphere by composting and using one ton of farm food scraps and yard waste vs. landfilling the same amount.

KEY TERMS:

Ecosystem Services: Nature provides countless benefits to people, along with intrinsic values. These components of nature are enjoyed, consumed, or used by humans to support our wellbeing.

Climate Resilience: The ability of a natural or human community to prepare for and respond to the impacts of climate change.
Grasslands and farmlands are often prime targets for development, since the land is open, relatively flat, and has soils that are easily manipulated. See our Losing Ground report and community planning resources for ways to reduce development impacts.

The Integrating Ecosystem Services Functions and Values into Land-Use Decision Making in the Narragansett Bay Watershed project was supported, in part, under Assistance Agreement No. SE - 00A00252 awarded by the U.S. Environmental Protection Agency (EPA) to Mass Audubon. The Lookout Foundation also provided funding to Mass Audubon. The Narragansett Bay Watershed Economy project was conceived and partially supported by the Coastal Institute at the University of Rhode Island under the leadership of Dr. Emi Uchida. Additional project partners include the URI Graduate School of Oceanography, the URI Coastal Resources Center, the Natural Capital Project at Stanford University, and the George Perkins Marsh Institute at Clark University. The views expressed in this project are solely those of the authors. It has not been formally reviewed by EPA. Additional information is available at www.nbweconomy.org.

**Threats**
Climate change and development are two of the biggest threats facing grasslands and farmland.

- **2.9°F RISE IN TEMP** since 1895
- **11" SEA LEVEL RISE** since 1922, as measured in Boston Harbor
- **55% STRONGER STORMS** since 1958

Grasslands and agricultural fields are experiencing climate change impacts like summer drought, freeze damage to early buds, and faster spread of invasive species.

**Development**
Grasslands and farmlands are often prime targets for development, since the land is open, relatively flat, and has soils that are easily manipulated.

See our Losing Ground report and community planning resources for ways to reduce development impacts.

**Climate Resilience**
Climate change threatens our ability to produce food, and food insecurity is already present in Massachusetts.¹¹

**$2.4B** POTENTIAL SAVINGS/YEAR in medical treatment costs by addressing food insecurity in Massachusetts.¹²

**Over $2M** Benefit to participants in Massachusetts’ Healthy Incentives Program (HIP) in the program’s first seven months, demonstrating demand for healthy, local food. HIP makes buying fruits and vegetables from farmers markets and other qualified local vendors more cost-effective for eligible low-income residents.¹³

**53 species** OF THE GREATEST CONSERVATION NEED make their home in Massachusetts’ grassland habitats, including the eastern meadowlark and bobolinks.¹⁴ Maintaining agricultural lands benefits several species that have declined significantly in New England over the past 50 years.¹⁵

**Green City Growers**
Green City Growers, an organization that converts unused spaces into urban farms, has grown more than 175,000 pounds of organic produce over less than 2 acres. Based on these production levels, it is estimated that just 1.6% of Boston’s 57,363 acres of land would be needed to meet the needs of at-risk Bostonians.¹⁷

**Recruitment & Tourism**
Participants in agri-tourism (a growing trend) and wildlife observers interested in grassland species spend money on classes and programs in local communities.

**$259K** Amount spent annually by visitors to 611 acres of grasslands managed by Mass Audubon.¹⁸

**125K** people visit and participate in educational programs annually at Mass Audubon’s Drumlin Farm.¹⁹
